

“Radar Plotting” for Research Infrastructures

This exercise is intended to help develop thinking about the kinds of roles research infrastructure plays in our work, and how, depending on its goals, a research infrastructure may show different characteristics.

By depicting your estimation of the level of emphasis an infrastructural development places on the development of different kinds of assets and profiles, you can begin to develop an appreciation both for that particular development and its implicit mission and value as well as for the full variety of interventions currently contributing to the infrastructural landscape.

This tool can be used with the list “But are they Infrastructures?” or to look at your own organisation as a support for strategic development.
